

Introduction for ACC FAC and Cycle Chemistry Session

Barry Dooley
Presented by Andy Howell
ACCUG 2019
Queretaro, Mexico
21st - 24th October 2019

Typical ACC Damage

Corrosion/FAC in ACC and The Consequences

- High concentrations of iron around the cycle
 - Boiler/HRSG deposits (expensive chemical cleaning)
 - Boiler/HRSG Tube Failures (overheating and TF)
 - Steam Turbine Deposits (including aluminum)
- Need for Iron Removal Processes
 - Condensate Polishing and/or Filters
- Limitations around the cycle
 - Condensate polishing (may have to change mode)
- Overall an ACC "controls" the unit cycle chemistry
 - International Guidelines now available for ACC and two-phase flow (IAPWS Volatile Guidance 2010, 2015)

The ACC Corrosion Index to Compare and Categorize Corrosion and Track Improvments

DHACI

(<u>D</u>ooley, <u>H</u>owell, <u>A</u>ir-cooled Condenser, <u>C</u>orrosion <u>I</u>ndex)

DHACI for Tube Inlets

- 1. Tube entries in relatively good shape (maybe some dark deposited areas)
- 2. Various black/grey deposits on tube entries as well as flash rust areas, but no white bare metal areas
- 3. Few white bare metal areas on a number of tube entries. Some black areas of deposit
- 4. Serious white bare metal areas on/at numerous tube entries. Lots of black areas of deposition adjacent to white areas
- 5. Most serious. Holes in the tubing or welding. Obvious corrosion on many tube entries

Examples included on later slides

DHACI for Lower Ducts

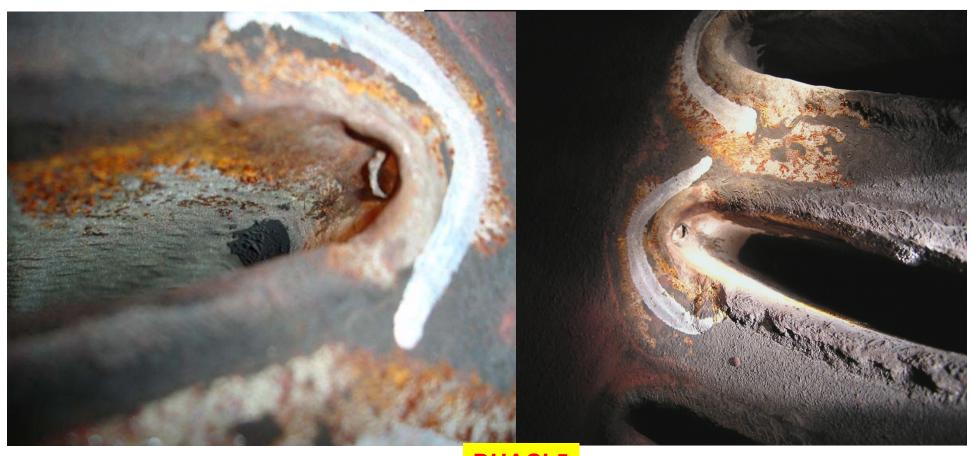

- A. Ducting shows no general signs of two-phase damage
- B. Minor white areas on generally grey ducting. Maybe some tiger striping with darker grey/black areas of two-phase damage
- C. Serious white bare metal areas in the hot box and at numerous changes of direction (eg. at intersections of exhaust ducting to vertical riser). White areas are obvious regions of lost metal.

We know what the Corrosion Looks Like

The FAC / Corrosion damage is the same worldwide with all cycle chemistries and plant types

and what Holes at Tube Entries Look Like

DHACI 5

Inspections Worldwide show the same Features

Combined Cycle with ACC after ~ 15,000 hrs, pH 9.1.

DHACI – Dooley, Howell Air-cooled Condenser Index

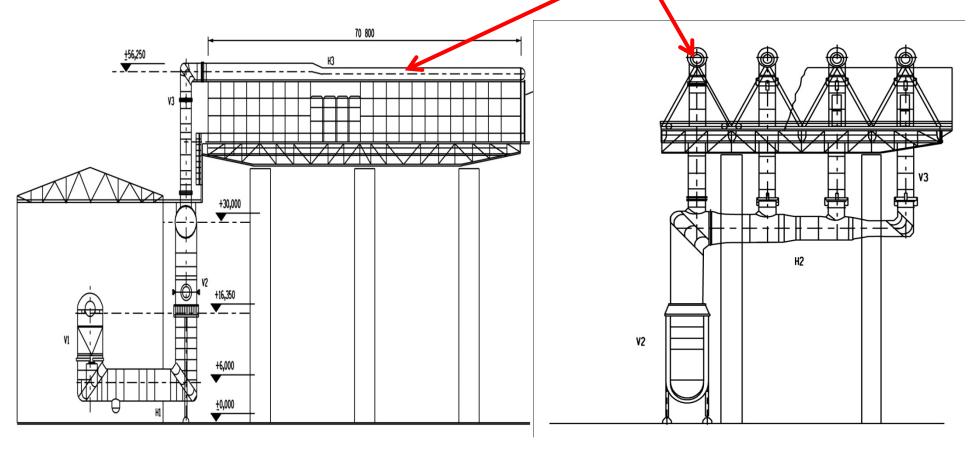

Inspections Worldwide show the same Features

750 MW Supercritical on OT at pH 9, ~4,000 hrs.

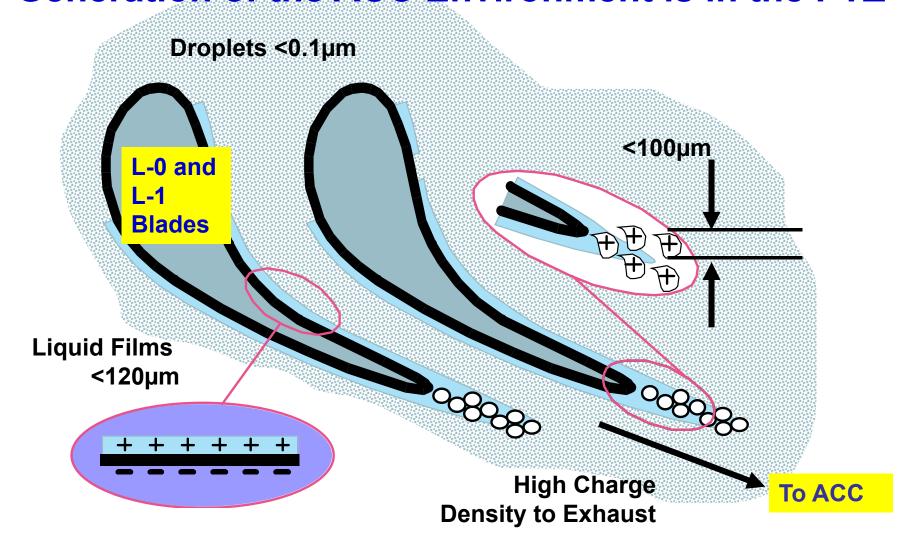

Concentration of Two-phase FAC beneath Supports

To Understand the Corrosion Here we need to Understand the Environment in the PTZ

Generation of the ACC Environment is in the PTZ

We Now Fully Understand the Environment but Can we Prevent the Corrosion Mechanism?

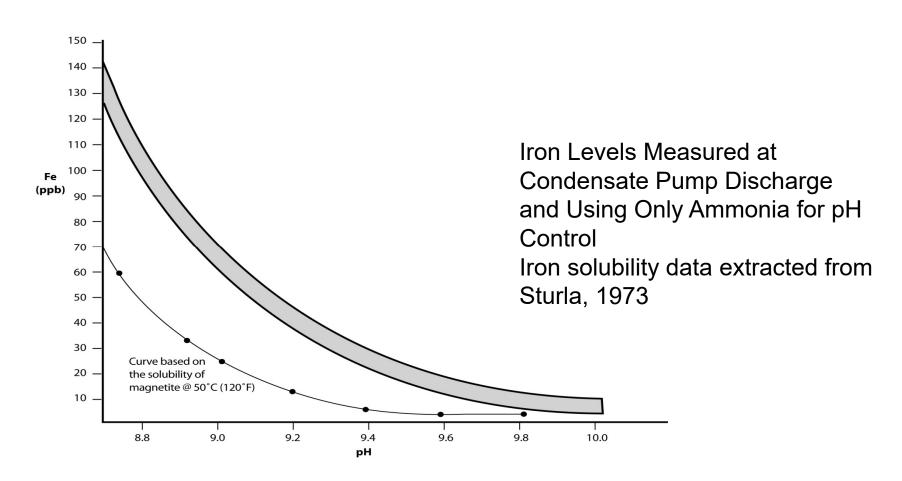

"Solutions" are being applied

Increase bulk condensate pH up to 9.8 – Works and is Validated Increase local pH (including FFS) – Appears to work but science not fully understood/explained

Filters (average and absolute) and condensate polishers – Can lower total iron but doesn't stop FAC/Damage

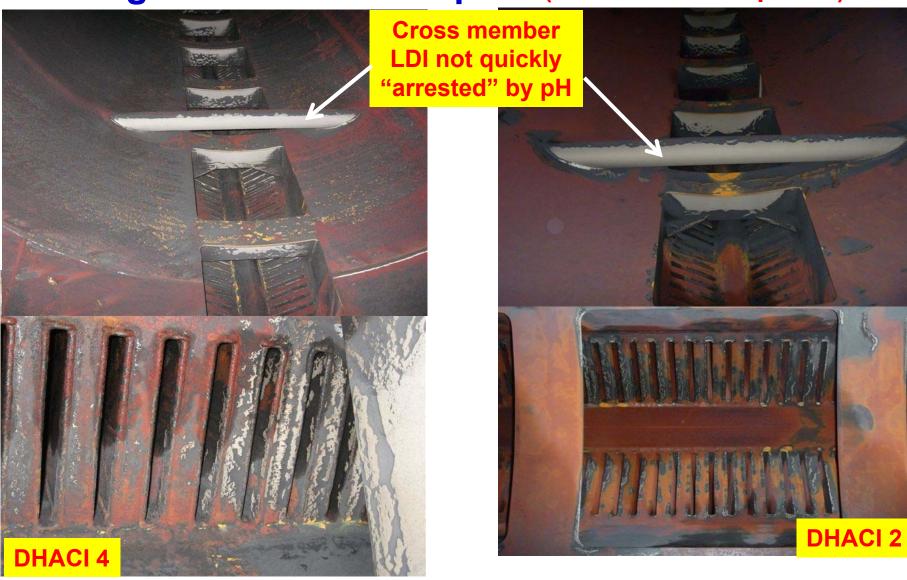

Coatings (epoxy), Sleeves, Inserts – Not sufficient information Alternate Materials to CS – very few cases and no validation Designs – various have been applied but FAC/Damage still occurs

The Total Iron vs pH is Consistent Worldwide (Dooley/Aspden pH Versus Iron Relationship)

Dooley, Aspden, Howell & DuPreez, PPChem 2009

Damage takes time to repair (ex. 2 Years with pH 9.8)

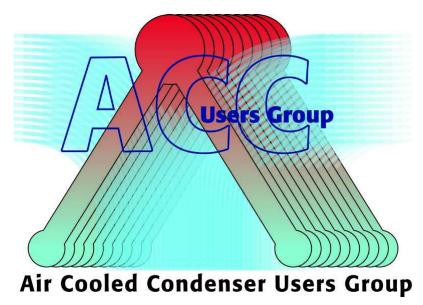

Damage takes time to arrest (15 Months with pH 9.8)

What Guidance is Currently Available?

http://acc-usersgroup.org/

ACC.01

Original Issue: May 12, 2015 Revision due: May 12, 2018

Guideline for Internal Inspection of Air-Cooled Condensers

International Association for the Properties of Water and Steam

IAPWS Technical Guidance Documents for Fossil and Combined Cycle Plants

(with particular relevance for plants with ACC)

IAP IAPWS Technical Guidance Documents for WS Fossil and Combined Cycle Plants & with ACC

- Procedures for the Measurement of Carryover of Boiler Water and Steam (September 2008). This document includes the procedures to measure carryover from drum boilers to assist in preventing steam turbine failure/damage. TGD1-08
- Instrumentation for monitoring and control of cycle chemistry for the steam-water circuits of fossil-fired and combined-cycle power plants (September 2015). This document includes a table that can be used to determine the minimum key level of instrumentation required for any fossil or combined cycle/HRSG plant. Also addresses fast and/or frequently started units. TGD2-09(2015)
- Volatile treatments for the steam-water circuits of fossil and combined cycle / HRSG power plants (July 2015). This document includes the basis for AVT and OT for all plants with customization for plants with ACC and using ammonia and amines. Recently added guidance for fast and/or frequently start TGD3-10(2015)

Freely available and downloadable on IAPWS website www.IAPWS.org

IAPWS Technical Guidance Documents Fossil and Combined Cycle Plants & with ACC

- Phosphate and NaOH treatments for the steam-water circuits of fossil and combined cycle / HRSG power plants (Oct 2015). This document includes the basis for selecting the optimum boiler/HRSG evaporator water treatment for (phosphate and NaOH treatments) for all plants with TGD4-11(2015)
- Steam Purity for Turbine Operation (Sept 2013). This document covers guidance for a wide range of turbines (fossil, nuclear, industrial, geothermal, etc) and failure mechanisms. It includes customizations for plants using amines and with carbon dioxide.

TGD5-13

Corrosion Product Sampling and Analysis (May 2014). This
document covers the optimum procedures and techniques for
monitoring iron and copper. Includes a table of achievable iron
levels for plants including those with ACC. TGD6-13(2014)

Freely available and downloadable on IAPWS website www.IAPWS.org

IAP IAPWS Technical Guidance Documents WS Fossil and Combined Cycle Plants & with ACC

- HRSG HP Evaporator Sampling for Internal Deposit Identification (Sept 2016). This document includes the locations where to take samples from HGP and VGP HRSGs, how to analyze the samples, and an IAPWS map to assist in determining whether the HRSG HP evaporator needs to be chemically cleaned.
 TGD7-16
- Application of FFS in Fossil, Combined Cycle and Biomass Plants (Sept 2016). This document covers optimum application guidance for FFA / FFAP in all-ferrous plants. It also includes customizations for shutdown / layup, multiple pressures, mixedmetallurgy feedwater systems, condensate polishing, and units with ACC.

Freely available and downloadable on IAPWS website www.IAPWS.org

International Association for the Properties of Water and Steam

Technical Guidance Document

Monitoring and Analyzing Total Iron in Fossil and Combined Cycle Plants

Achievable Total Fe & Cu Levels – Different Plant Types/Optimized Chemistry

(Indicative that FAC/Corrosion is "under control")

Feedwater

OT: Total Fe = $< 1 \mu g/kg$

AVT: Total Fe = $< 2 \mu g/kg$

AVT (Mixed): Total Fe & Cu = $< 2 \mu g/kg$

HP/LP Heater Drains: Total Fe & Cu = $< 10 \mu g/kg$

HRSG Evaporators/Drums

AVT/PT/CT: Total Fe = $< 5 \mu g/kg$

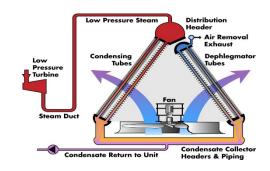

Air - cooled Condenser (ACC)

ACC Outlet: Total Fe = $< 10 \mu g/kg (ppb)$

Post Condensate Filter: Total Fe = $< 5 \mu g/kg (ppb)$

Discussion Items for ACCUG 2019

Film Forming Substances (FFS) Air In-Leakage

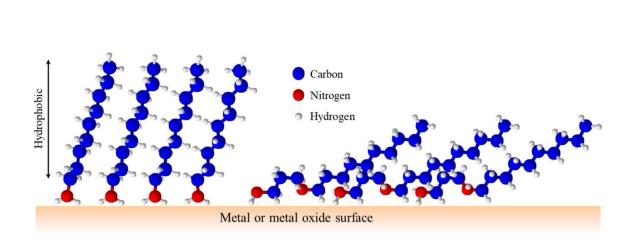

ACCUG 2019
Queretaro, Mexico
21st – 24th October 2019

Film Forming Amines (FFA)

Octadecylamine – ODA Oleyamine – OLA Oleyl Propylenediamine - OLDA

Film Forming Substances (FFS)

New International Nomenclature

Lots of confusion worldwide on amine (FFA/FFAP) and non-amine (FFP) based substances. IAPWS introduced the new nomenclature for FFS

Film Forming Substances (FFS)

ACC "Arrests" with FFAP

Cross member appear to repair using FFAP

Courtesy Bill Stroman

ACC Arrests with FFP

Film Forming Substances Possible Benefits of FFS

- Suitable for all-ferrous and mixed-metallurgy feedwater systems
- Optimum pH control in water and steam
- Lower corrosion product generation and transport
- Cleaner steam turbines
- Possible Improvement of steam turbine efficiency
- Benefits for oxidizing and reducing chemistries
- Avoids BTF / HTF due to Under-deposit Corrosion & Corrosion Fatigue
- Shutdown protection under wet and dry conditions
- Shorter startup times
- Reduced or arrested FAC (single- and two-phase)
- Improved or eliminated ACC corrosion / FAC

Film Forming Substances

Numerous "reported" problem as well as some major open issues

- **Deposits in Boilers (tubes, drums) and Turbines**
- Tube failures due to heavy deposits
- Decomposition of added alkalizing amines
- Elevated CACE in condensate and steam
- Mis-identification of the real contaminants
- Numerous proprietary mixes and blends
- Analysis of FFS and amount to use
- Increased boiler / HRSG evaporator deposition
- Increased levels of deposits in tubes, headers, drums
- BTF / HTF due to UDC and Overheating
- No rugged application processes
- Very variable ("poor") detailed documentation of FAC
- Variable detailed documentation of ACC corrosion/FAC

Film Forming Substances Goals for Understanding

- Plant studies have not been definitive enough and very simple to show reduced corrosion products
- There is a need to raise the bar providing the world with answers on the main failure / damage mechanism and processes. (Apply Section 8 of the IAPWS TGD)
- Can we avoid BTF / HTF due to UDC & CF?
- Can we reduce /eliminate single- and two-phase FAC?
- Can we provide shutdown protection in steam & PTZ
- Shutdown protection under wet and dry conditions
- Basic understanding for attachment of hydrophobic FFS film to iron (magnetite and hematite) and copper oxides (cuprous and cupric)

International Association for the Properties of Water and Steam

Technical Guidance Documents

Film Forming Substances

Received final review and approval from 24 countries involved in IAPWS. Reviews have included most of the chemical supply companies and most of the Steam Turbine, Boiler & HRSG Manufacturers

Published at IAPWS Meeting, September 2016 Dresden, Germany

Technical Guidance Document - FFS

Base Case Guidance

- Operation. All-ferrous fossil, combined cycle and biomass plants. "Section 8"
 - Which FFA to use
 - "Monitoring 1" baseline before use
 - How much to dose and where
 - How to analyze content of FFA in cycle
 - How to determine optimum use (Monitoring 2)

Customization Guidance

- 2. Shutdown/Layup
- 3. Different FFP and Combinative Mixtures
- 4. Major Components with Copper or Aluminum
- 5. Different Temperature / Pressures
- 6. Systems with ACC and Condensate Polishers
- 7. Seawater cooling and Desalination
- 8. Industrial Plants (hints only)

IAPWS TGD will be non-commercial and contain no proprietary items

Some Final Thoughts on "corrosion" in ACC

Based on work conducted in Australia, Canada, Chile, China, Cote d'Ivoire, Dubai, India, Ireland, Mexico, Qatar, Abu Dhabi, South Africa, UK and US

Increasing condensate pH to 9.8 will gradually eliminate the FAC damage at the tube entries and iron levels will reduce to IAPWS suggested levels (5 - 10 ppb). Documented by reducing the DHACI. FFS also work but not sufficient detailed documentation before and after application.

Damage on cross members is not "arrested" as quickly by increasing pH. Is this LDI caused by the larger droplets leaving the PTZ of the LP Steam Turbine?

Summary

- Some aspects relate to (LT Two-phase) FAC
 - Adjacent black and white areas in severe turbulent areas
 - Increasing local pH reduces damage
- But some aspects don't (normal FAC scalloped appearance and white areas on cross members is probably LDI)
- Environment is known and has been measured
 - Two-phase mixture formed in PTZ of the steam turbine
 - Concentrating liquids (Higher in chloride/sulphate, organics)
 - Lower in pH (0.5) and very low in dissolved oxygen (close to zero)
- "Arrested" two-phase FAC areas turn red slowly
 - Mechanism in ACC is thus not totally understood & what are amines doing?
- Some good results using amines and FFS
 - But need more fully documented cases (before and after, total iron levels,)
